

Legamart Test Specification

Hi Here is your test , please share with us your estimation time to implement.

Create a website which lets users share their locations like the below pictures:

The image shows a web browser window with a single tab labeled 'Home Page'. The address bar contains the URL 'https://www.example.io'. The main content area displays a 'Share location' form. The form has a blue header bar with the title 'Share location'. Below the header, there are four fields: 'Location name:' with a text input box; 'Location on map:' with a map image showing a green pin; 'Location type:' with a dropdown menu currently showing 'Busines'; and 'Logo:' with an 'Upload' button featuring a blue arrow icon. At the bottom of the form are two buttons: 'Cancel' and 'Save'.

Home Page

https://www.example.io

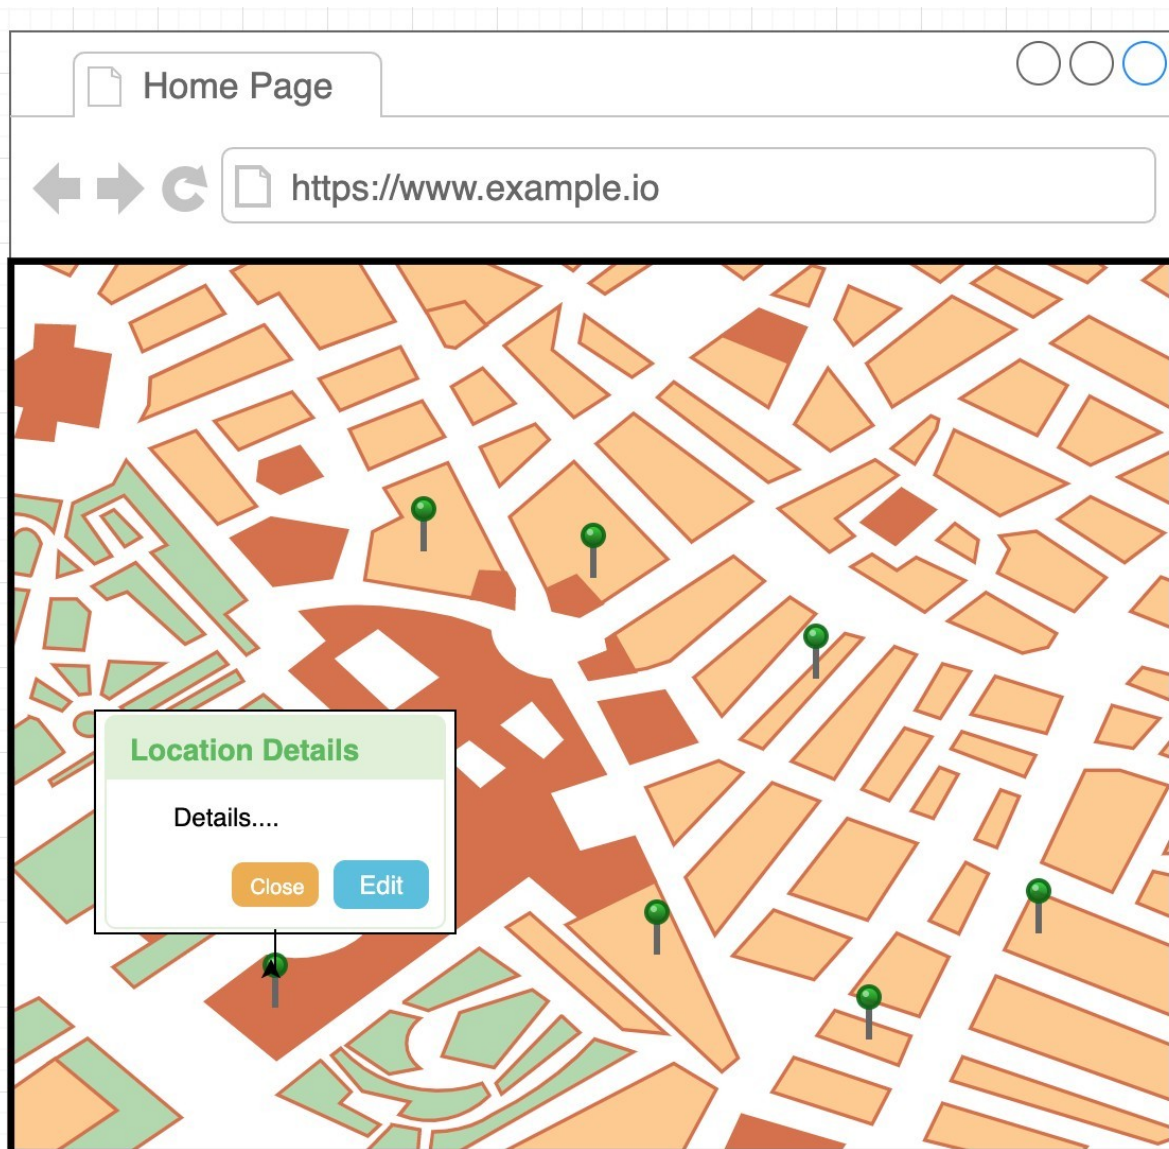

Share location

Location name:

Location on map: 

Location type:

Logo:

You can use an in-memory object (eg: Redux ,Mobx , Context ,Zustand ,...) as a datastore to store the data.

Emphasis should be placed on making use of:

- Map component (eg: Leaflet or Mapbox)
- Pure CSS
- Flexbox or Grid
- CSS Layout (positioning)
- Responsiveness (Only desktop screens)

When you have completed the application, there will be a code review and a discussion of how you developed the application. Following strict coding conventions (clean code) and commenting on your code is not necessary unless it will aid you in the code review.

Do not hesitate , if you have any question you can ask . (amirnuam@gmail.com)

After Implementation Please share us with in gitlab Repository (my Id in gitlab : amirnuam)
